

Test Case: Multiple Audio Attachments

This PDF carries three audio files at once, in two different formats. A viewer that handles attachments properly should list all three and let each be played independently.

Attached files

- **interview-part-1.mp3**
Interview recording, part 1 — MP3 · low tone (220 Hz)
- **interview-part-2.mp3**
Interview recording, part 2 — MP3 · mid tone (440 Hz)
- **voicemail-evidence.wav**
Voicemail submitted as evidence — WAV · high tone (880 Hz)

What this tests

Each pitch is distinct, so it is audible which file is playing and whether the players are wired to the right attachments rather than all pointing at the first one. It also mixes MP3 and WAV in a single document, and puts three players in the panel at once to see how the layout copes.
